

IN THE CLAIMS

- Sum  
B4  
ex  
D1
29. (New) A system comprising:  
a computing device having a management application and an alert proxy, the alert proxy  
to translate command data received from the management application into device-specific  
control data; and  
an other computing device coupled to the computing device having a platform-  
independent alert detection element to report detected alert events to the computing device.
- A2  
sub  
ex  
D1
30. (New) The system of claim 29 wherein the alert detection element further to  
receive the translated command data and using the translated command data to set or clear  
registers within the other computing device.
31. (New) The system of claim 29 wherein the alert proxy further to transform  
device-specific alert data into plain text explanations of the alert.
